Annual Lawn Care Program

Contact us now to enroll in this year's lawn care program. Get your lawn in shape for the great outdoor seasons! Perhaps you've started the process and have determined you want to leave this to the professionals. Our team will move in and take over your lawn care treatment program this year and for years to come.

STEP 1 – initial phase to prevent crabgrass (and other seeds) germination; destroy early invasive broadleaf weeds (Now thru early April). Maybe you don't see these lawn enemies but if they aren't prevented from growing they will show up sooner or later. Get rid of them now!

STEP 2 – second phase in the on-going destruction of all broadleaf weeds; step 2 includes the second round of crabgrass prevention for aximum control. (late April thru May). Yes, we are still at it - fighting all those easy-to-grow weeds that cause lawns to lose their luster and become hard to manage. We fight the weeds and drive them out of your yard.

STEP 3 – grub control applied; watering is essential afterwards. (June or July; weather dependent). So often people don't realize they have grubs. Sure, go ahead and try the beer remedy. But, what a waste of good beer! You're much better off relaxing and letting us rid your ground of grubs.

STEP 4 – Broadleaf weed control for fall weeds and a and fertilizer application to prepare your lawn for a beautiful fall (early Fall). Fall brings changes for your yard. It's a time to be rid of different weeds and pump the yard up to retain its natural beauty for this wonderful season, a favorite of many.

STEP 5 – Final fertilization to stimulate good root growth and ready your lawn for its winter rest and early spring boost. Is a fungus showing up in your yard? Call us about treatments today! Winter can be tough on young plants so you want to give them every chance of shelter and survival, building strength while "hybernating". Nature does have a way of taking care of things; we enhance and help the process along.
